Abstract: The resin DAPT was derived by condensing 2, 6-diaminopyridine (0.1 M) and terphthalic acid (0.1 M) in presence of DCC (Dicyclohexylcarbodiimide). The materials were characterized by using elemental analysis, $^1$H NMR, $^{13}$C NMR, FT-IR and UV-Vis spectra. The molecular weight of resin was determined by non aqueous conductometric titration. In the present paper, electrical conductivity properties of the resin DAPT was studied over a wide range of temperatures. The conductivity of DAPT was found to be in the range 0.1379 to 0.1583 $\mu$S cm$^{-1}$ for temperature range 333-423 K. The activation energy of conduction for DAPT was found to be 0.7692 kJmol$^{-1}$.

Introduction

Semiconductors are the most important ingredients of modern electronics. The concerted research effort was carried out to aim at developing organic materials that would possess the good electrical properties as the inorganic semiconductors\textsuperscript{1}. In fact conductivity depends upon the external conditions such as temperature, humidity, pressure, thickness of samples as well as its chemical structure\textsuperscript{2}. Semiconducting polymer have been the subjects of study for many decades for day to day application product, such as corrosion protection and antistatic coatings, in biosensors for coupling of electron transfer, fabrication of electrochemical windows and gas sensors, development of individual electronic devices and whole integrated circuits\textsuperscript{3-7}. Electrically conducting polymer resins are one of the important points of current interest in solid state physics and chemistry.

2, 6 Diaminopyridine was used in flurometric studies of novel photoactive polyamide\textsuperscript{8}. The derivatives of pyrene, other condensed aromatic hydrocarbons and some heteroaromatic hydrocarbons such as pyrazoline are more considerable in the preparation of photoluminescence polymers\textsuperscript{9}. Many coworkers reported the use of 2, 6 diaminopyridine in synthesis macro cyclic ligand for chelation with metal ions such as Ni(II), Cu(II), Cr(III), La(III), Pb(II), Cd(II) and Zn(II) which obviously open up fascinating area of research in
coordination chemistry\textsuperscript{10-11}. Masram reported the synthesis and electrical properties of resins. The electrical resistivities of 2-hydroxyacetophenone-phenoxime-thiourea-trioxane resin were reported, these polymers ranked as semiconductors\textsuperscript{12}.

In this connection many researchers have made attempt to improve the conducting property by changing the composition of monomers by deposition of conducting polymers on the surface copolymer to satisfy electrical properties\textsuperscript{13-15}. Recently Hiwase \textit{et al.} have characterized \textit{p}-hydroxybenzaldehyde-resorcinol-formaldehyde and \textit{p}-hydroxyacetophenone-hexamine-formaldehyde\textsuperscript{16-17}. Dharkar \textit{et al.} studied the conductivities of melamine-aniline-formaldehyde terpolymer resins and its polychelates. The activation energy values were found to be in range of 0.847 to 1.156 eV\textsuperscript{18}. Kushwaha \textit{et al.} reported semiconducting behavior of resin derived from \textit{p}-Nitrophenol, Resorcinol and Formaldehyde and Kapseet \textit{et al.} carried out the study of terpolymer resin \textit{p}-hydroxyacetophenone-quinhydrone–melamine for its semiconducting property. The DC conductivity of sample was determined by two probe method\textsuperscript{19-20}. The present paper deals with the structural analysis of newly synthesized copolymeric DAPT resin and its electrical conducting behavior is reported.

**Experimental**

Chemicals were obtained from Merck, Qualigens and S.D. Fine in AR and chemically pure grade.

**Synthesis of DAPT copolymer**

The DAPT copolymer was prepared by condensing 2, 2 dianinopyridine (0.1 M) and terphthalic acid (0.1 M) at 70-75 °C. In oil bath for 9.00 hours with intermittent shaking. The pale white colored product so obtained was repeatedly washed with hot water to remove unreacted materials. The copolymer was dried and powdered. The product was washed with 0.1N HCl to remove unreacted 2, 6- diaminopyridine followed by several washing with hot water. It was further purified by dissolving in 2% NaOH then filtered and reprecipitated by gradual drop wise addition of 1:1HCl with constant and rapid stirring in order to avoid lump formation. The DAPT copolymer so obtained was washed several times with hot deionized water and dried in vacuum. The purified copolymer washed, finely ground to pass through 300 mesh size sieves and kept in a vacuum over silica gel. The yield of the copolymer was found to be about 74%. The reaction scheme for synthesis of DAPT is shown in Figure 1 (Table 1).

Results and Discussion

**Elemental analysis and molecular weight of DAPT resin**

The elemental analysis (C, H and N) of copolymeric resin was carried out at Sophisticated Analytical Instrumental Facility (SAIF), Indian institute of Technology (IIT) Bombay. The average degree of polymerization of resin sample was determined by titrating 25 mL of 0.1% solution of resin in DMF against 0.1 M KOH solution in absolute alcohol, conductometrically. The conductance was plotted against the miliequivalents KOH per 100 g. of resin. The inspection of plot revealed that there were many breaks in the plot. The DP was calculated by using following equation,

\[
DP = \frac{\text{Milliequivalent of base required for complete neutralisation}}{\text{Milliequivalent of base required for smallest interval}}
\]  

(1)

The molecular weight of resin was determined by using following relation,

\[
M_n=DP \times \text{Molecular weight of the repeating unit}
\]  

(2)

The repeating unit weight was obtained from elemental analysis. The elemental analysis and molecular weight determination data of DAPT resin are given in following Table 2.

**Spectral analysis**

FTIR spectra of synthesized copolymeric resins were recorded at Department of Pharmacy; RTM Nagpur University, Nagpur Using FT-IR spectrophotometer Shimadzu, Model No-8101A. \(^1\)H and \(^13\)C NMR spectrum of copolymeric resin using DMSO-d\(^6\) solvent was scanned on BRUKER AC II 400 NMR spectrophotometer SAIF, Punjab University, Chandigarh. UV-VIS spectra of copolymer resin in DMSO solvent recorded by UV-VIS Double Beam Spectrophotometer Shimadzu, Model No-1701 fitted with automatic pen chart recorder at Department of Pharmacy, RTM Nagpur University, Nagpur.

*FTIR spectrum data of DAPT resin*

FT-IR spectrum is shown in Figure 2 and related data\(^{21-22}\) is tabulated in Table 3.
The absorption band at 3103 cm$^{-1}$ was assigned to N-H stretching in secondary amide. The broad band at 3062 cm$^{-1}$ was assigned to C-H aromatic stretching. The absorption at 1691 cm$^{-1}$ was assigned to $>$C=O amide (I) band. Further low value of this band was supported to formation of polyamide. The band at 1510 cm$^{-1}$ was due to the coupling of N-H bending and C-N stretching absorption (amide II band) indicates the presence of secondary amide group (amide linkages). The sharp band displayed at 1573 cm$^{-1}$ was assigned to N-H deformation. The band display at 1651 cm$^{-1}$ was assigned to C=C in Pyridine ring. The absorption at 1427 cm$^{-1}$ was attributed to C=N stretching in Pyridine ring. The bands appeared at 1296 cm$^{-1}$ and 1288 cm$^{-1}$ were attributed to C-N stretching in secondary amide. The peaks at 1020, 997 cm$^{-1}$ were due to C-O deformation in CONH-. The peaks at 879 cm$^{-1}$ was assigned 1, 4 disubstituted aromatic rings. The peaks at 1114, 1112, 783,731 cm$^{-1}$ was assigned to 1, 6 disubstituted pyridine rings.

$^1$H NMR and $^{13}$C NMR spectrum of DAPT resin

The $^1$H NMR and $^{13}$C NMR spectrum is shown in Figure 3 and Figure 4 respectively.
In $^1$H NMR spectrum of DAPT copolymer the signals at 8.0 $\delta$ ppm was attributed to N-H in amide linkages. The signal at 8.07 $\delta$ ppm was due to proton in pyridine ring. The signal at 2.50 $\delta$ ppm was due to DMSO solvent. In $^{13}$C NMR spectrum of DAPT copolymer the signal at 129.14 $\delta$ ppm was assigned to carbon in terphthalic acid moiety. Signal at 134.33 $\delta$ ppm was due to carbon in pyridine ring. Signal at 166 $\delta$ ppm was attributed to $>\text{C}=\text{O}$ carbonyl carbon in amide linkages $^{23-24}$.

**UV-VIS spectrum of DAPT resin**

The UV-Vis spectrum is shown in the Figure 5. The inspection of UV-Vis spectrum of DAPT resin reveals two types of transition $\pi - \pi^*$ and $n- \pi^*$ transition. The important UV-Vis absorptions data are tabulated in Table 4.

**Electrical conductivity of DAPT resin**

The DC conductivities of DAPT resin was studied for wide temperature range. The electrical conductivity as a function of temperature of the polymer was studied. The electrical conductance of polymeric materials depends upon incalculable parameters such as porosity, pressure; method of preparation and atmosphere$^{25-26}$. The powdered samples of DAPT resin was palatalized by hydraulic press at pressure of 17lb inch$^{-2}$. The surface of pallet was made conducting by applying graphite paste. The diameter and thickness was measured using screw gauge. The solid state conductivity as function of temperature was recorded by two probe method$^{27}$. The plot of log $\sigma$ versus $1/T$ was found to be linear in the temperature range under study, which indicate that the Wilson’s exponential law, $\sigma = \sigma^0 \exp \left(\frac{-E_a}{kT}\right)$ was obeyed.

Where, $k=$Boltzmann constant. $\sigma=$Electrical conductivity at temperature $T$. $\sigma^0=$ Electrical conductivity at temperature $T\to\infty$. $E_a=$Activation energy of conduction. The energy of activation (Ea) of electrical conduction of DAPT resin calculated from the slope of the plot. Electrical conductivity plot of DAPT resin is given in Figure 5. Electrical conductivity data of DAPT resin is shown in Table 5.
Conclusion
The elemental analysis and spectral studies such as UV-VIS, IR, $^1$H NMR, $^{13}$C NMR data is in good agreement to the above assigned tentative structure of DAPT copolymer shown in Figure 2. The plot of log $\sigma$ versus $1/T$ is linear with negative slope hence satisfy with Wilson’s equation. Thus the resin shows semiconducting behavior. The plot shows that the conductivity exponentially increases with increase in temperature from 333 K to 423 K. the conductivity values are ranges from 0.1379 to 0.1583 $\mu$S cm$^{-1}$ in mentioned temperature range.
